WORK EXPERIENCE

HubSpot Remote / Cambridge, MA
Technical Lead *Nov 2025 – Present*

- Leading a backend team of up to 5 engineers, including a principal engineer, for the Lead Scoring product. Setting technical direction, shaping product strategy, and mentoring engineers, one of whom was recently promoted to Senior Software Engineer 1.
- Simplified the deeply nested scoring model into schemas that fit OpenAI's tool-calling spec, enabling agents to build complex scoring rules and tune point assignment, so users can turn high-level goals into effective scores.
- Spearheaded a multi-quarter effort to stabilize and scale the system to handle 1 billion evaluations per day, including skipping unused rules (~20% fewer evaluations) and batching evaluations to cut CRM object fetches by 40%. Brought on-call alerts from 23+ a week to under 12, even after inheriting the ML team's model-driven scoring service.
- Championed modeling Ideal Customer Profiles (ICP) as fit scores instead of rigid boolean filters, which natively allows partial matches and outputs a stack-ranked list of best-fit accounts; wrote the PRD and built the prototype.
- Proposed a feedback loop to continuously improve the scoring model, starting with score-to-conversion tracking to measure how well scores predict conversions: wrote the PRD, designed the UI in Lovable, and built it.

Senior Software Engineer 1 *Feb 2023 – Oct 2025*

- Developed a platform for lead and customer health scoring, building features like bulk evaluation and reporting.
- Cut compute costs by over 80% (from $1K to under $200 a day) by redesigning a Spark pipeline on Iceberg/S3 that correlates lead engagement activity with conversions, live for ~15K customers and growing. Integrated with Segments to create engagement scores using activity criteria with high Wilson-score confidence, and rank segments on the fly.

Software Engineer *Jul 2021 – Jan 2023*

- Owned cloning, inheritance, and the global delivery infrastructure for web assets in the HubSpot CMS.
- Collaborated with marketplace quality, legal, and business development teams to raise marketplace asset quality.
- Revamped asset validation and automated all checks, cutting internal review time from 3+ hours to under 15 minutes per theme and reducing development time for external providers.

Software Engineer Co-op *Jan 2020 – May 2020*

- Extended the GitHub PR Feedback tool to automate breaking-change detection across 10,000+ HubSpot APIs.

Qualcomm San Diego, CA
Software Development Engineer Intern *May 2019 – Aug 2019, May 2020 – Aug 2020*

- Implemented licensing on the SoC over MQTT and built a React Native app for remote control of device features.
- Developed a full-stack portal hosted on AWS that enabled admins to manage licensing through the app.

Yupik Language Laboratory Champaign, IL
Research Assistant *Feb 2019 – Dec 2020*

- Started building an end-to-end speech translation model with deep learning to help revitalize St. Lawrence Island Yupik, an acutely under-resourced indigenous language.

EDUCATION

University of Illinois at Urbana-Champaign Champaign, IL
Bachelor of Science *May 2021*
Computer Science + Linguistics, Math (minor), GPA: 3.79

PROJECTS

Aria Personal AI assistant built in Python with LangChain and LangGraph: 3-tier memory system, proactivity engine, tiered LLM router, and Telegram and Home Assistant integrations, covered by ~190 tests and in daily use.
SyntaxTrees C++ application that generates a sentence's syntax tree using X-bar theory and dynamically renders it.
Hauntd Implemented geospatial search using the Haversine formula for a website to find nearby haunted locations.

SKILLS AND TECHNOLOGIES

Programming Languages Java, Python, C++, SQL, C, JavaScript, Kotlin, Clojure, Bash
Data & Infra MySQL/Vitess, HBase, Spark, Iceberg, AWS, GCP, MongoDB, ChromaDB
AI LLM agent tool design, Evals, MCP, LangChain, LangGraph, System One/Jev
